Air Quality

The potential impact from new sources of air pollution is becoming a real issue for local authorities and needs to be considered during the planning process for any development.

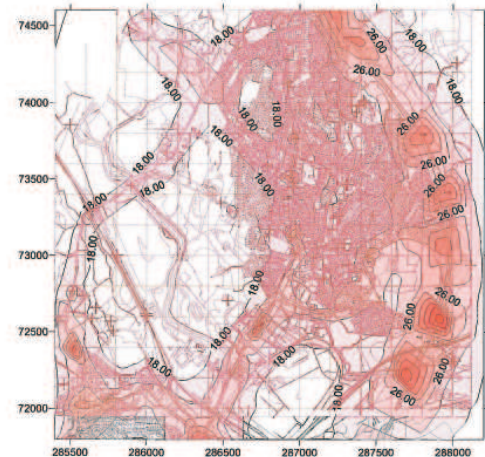

Stuart Michael Associates Limited (SMA) are able to undertake local air quality assessments for different sources by employing a range of tools. These include, screening assessments, dispersion modelling and pollutant monitoring.

Discussions are held with local authorities early on in the planning stage to agree a scope for the assessment producing a comprehensive and robust air quality impact assessment. The reports include qualitative and quantitative assessments of changes providing sufficient information for a planning decision to be made.

Previous projects include DMRB screening assessments for residential developments, detailed dispersion modelling of residential developments with CHP plants and stack emissions from proposed industrial processes.

NEWCROSS, KINGSTEIGNTON, DEVON
